Abstract (en)

The catalyst of the invention comprises a hydrogenation component (Group VI and/or Group VIII Metal(s)) and a support comprising agglomerates of alumina having initially not more than 0.20 cc g of pore volume in macropores of diameter 400 Angstrom units and greater. The alumina agglomerates comprise less than 10 wt.% of silica. The agglomerates may be prepared under agglomeration conditions including a heat input rate in the rate of from 4,166 to 18,888 calories hour/gram of alumina to obtain the stated maximum macroporosity volume. The low macropore catalyst is useful in processes for the hydroconversion of hydrocarbonaceous oils.
