Abstract (en)
[origin: EP0024646A1] The beach chair has a base (1) and an upper portion (3) pivotable to an inclined position about an axis (2). A moving slide (10) is arranged on a bar (9), on each side of the front edges of the upper part (3). This slide provides a guiding and locking mechanism in the desired position. A cylindrical lug (11) of the guiding mechanism is received in a horizontal groove (6) provided in the upper part of the base sides (4). An opening (7) is provided rearwardly, at the back end (E) of the horizontal groove for an additional displacement of the guiding lug (11). The upper edge (12) of the opening (7) does not exceed the distance which corresponds to the shortest distance from the center of the axis (2) to the outer contour of the diameter of the lug (11), when the slide (10) is in the lower final position on the bar (9). In at least one position, the lug (11) gives to the back wall of the upper part (3) a horizontal position. The opening (7) has preferably a cutting (8) shaped as an arc of a circle. The opening (7) and the cutting (8) are reinforced by one or a number of fittings (14, 14', 14'') fixed onto the side (4). The upper part (3) may be provided with a hinged, lockable rest (19), having optionally a foot (20).
