Abstract (en)

[origin: WO8100542A1] A shear seal assembly (65) has an inner sleeve (66) and an outer sleeve (68) with an elastomeric material bonded therebetween. One sleeve (66, 68) has a circumferential groove (74) formed in the exposed wall (76) thereof in which groove (74) an O-ring (78) nests. The assembly is mounted between two telescopic members (28, 38) that have limited relative rotation. The sleeve without the groove (74) is press fit on or in one member (28, 38) and the sleeve (68) with the groove (74) will be spaced from the other member (28, 38) so that the O-ring (78) will extend from the groove (74) into sealing contact with said other member (28, 38). Clips or retainers (82) are provided for seating the grooved sleeve (66, 68) to said other member (28, 38) whereby limited relative rotation or oscillation between the members takes place without rupturing the elastomeric material. The shear seal can be removed without destroying the shear seal structure so that it can be reused.
