Abstract (en)
[origin: WO8001988A1] Ski brake comprising two pivoting arms intended to be arranged on either side of a ski and of which the active parts are movable between a lowered braking position and a retraction raised position, the opposite ends thereof carrying a control pedal. In said brake, both ends of the pivoting arms, opposite to the active portion thereof, are connected directly one to the other by a hinge (14), on the other end, the control pedal (8a) is hinged on the portions of said arms located between this connection point and the pivoting axis thereof, about two axes (11a) inclined in the reverse direction with respect to a line transversal to the ski. Thus, after the raising of the active portions of the braking arms, under the effect of the pressure of a ski boot on the opposite ends thereof, the folding back of the control pedal (8a) against the ski causes the bringing together of the active portions of the braking arms above the ski. The present brake is intended to be mounted on skis.
