Abstract (en)

[origin: EP0025955A1] 1. A piezo-electric transducer for radiating a ringing tone, having a transducer plate (3) clamped between two elastic support bodies (4, 5) at the edge thereof and provided with a piezo-electric layer (2) controlled by a ringing tone oscillator, which supplies two a.c. signals, in particular for telephone installations, characterised in that the frequencies of the signals are tuned to two resonance frequencies of the transducer, the one resonance frequency being determined by the fundamental oscillatory resonance of the transducer plate (3), and the other resonance frequency being determined by a Helmholtz resonator (7 and 8, C) arranged on the sound-radiating side of the transducer plate.
