Abstract (en)

[origin: WO8002128A1] Process for automatically running a semi-continuous system of passenger transport with passive vehicles. All defects constituted by an overloading of passengers or transported objects are detected with respect to a surface limiting the access to vehicles (5, 6, 7) in the stations with a view to progressively implementing a signalisation, to slowing down and stopping the lanes VI to VI5, these measures being then progressively cancelled after disappearance of the defect. Application to the transportation of passengers along hectometric distances.
