Abstract (en)

[origin: EP0026237A1] A metal-metal-type amorphous alloy having a fundamental composition represented by  $XaZc$  (wherein X represents one two or more of Fe, Co, and Ni, a represents 80-92 atom %, Z represents Zr, and c represents 8-20 atom %, with the sum of a and c being 100 atom %) and containing Zr as a metal for making the alloy amorphous, and articles manufactured from the alloy. As compared to metal-semimetal type amorphous alloys, this alloy undergoes less change with time or undergoes less embrittlement due to the essentially metal-metal-type properties of this alloy and, in addition, is excellent in strength, hardness, corrosion resistance, heat resistance etc., while retaining the magnetic properties of iron.
