Abstract (en)

The invention concerns a flexible container (10) for transport and storage of bulk goods and comprises a jacket (11a), a bottom (12) and a filling aperture (13) and said container (10) having been provided with lifting loops (14a,b, 15a,b), respectively for lifting the container, said lifting loops of the container have been formed of flap-like parts (14a,b, 15a,b) which are direct extensions of the upper part of the jacket (11a) of the container, and that said flap-like parts have been mutually connected by connecting seams (16,17) in such manner that said connecting seams have been disposed to run at a substantial distance from the central area of said lifting loops. This container can be formed of a hose-like blank so that the lifting loops of the flexible container will reliably withstand all those major stresses which may act on the lifting loops in conditions of actual practice.
