Abstract (en)
Corrosion resistant glassy metal alloys are provided which evidence a greater degree of corrosion resistance than prior art glassy metal alloys and conventional crystalline stainless steel alloys. The corrosion resistant glassy metal alloys consist essentially of from about 0 to 18 atom percent nickel, from 7 to about 21 atom percent chromium, from 0 to about 8 atom percent molybdenum, from about 13 to 18 atom percent of at least one element selected from the group consisting of phosphorus, carbon and boron, other than phosphorus plus carbon, and the balance essentially iron with the proviso that the ratio of phosphorus to the sum of phosphorus, boron and carbon is greater than or equal to 0.64.
