Abstract (en)

[origin: EP0027488A1] 1. A timber construction element consisting of a round-timber side section (6) which has been shaped so as to be substantially trapezium-shaped in cross-section and which is symmetrically bounded by a base surface (7), a cover surface (8), which is approximately parallel to the latter, and two side surfaces which extend obliquely, approximately in accordance with the annual rings, characterised in that the substantially oblique side surfaces are composed of an obliquely extending partial surface (9) and of a pair of partial surfaces (10, 11), which are parallel to each other and of equal length, enclosing the obliquely extending partial surface and adjoining the base surface (7) and the cover surface (8) respectively of the trapezium cross-section and extending angularly thereto and angularly to the oblique partial surface (9).
