Abstract (en)

This invention relates to the fabrication of articles at least a portion of which has an electroplated gold coating thereon having a Knoop hardness of at least 100. The articles are produced by cold forming a material at least a portion of which has an electroplated Additive-Free Hard Gold deposit possessing said hardness but including no more than 0.1 percent of hardening metallic ingredients. Relatively high ductility of the electroplated Additive-Free Hard Gold permits article fabrication which involves cold deformation of plated members. Permitted cutting, stamping and other cold post-plating procedures allow fabrication approach not possible with alloy hardened gold.
