Abstract (en)

[origin: ES254160U] The assembly comprises a structural member, for instance one made out of wood, surrounded by a sheath member made out of rigid or semi-rigid plastic material, the outer contour of said core member and the inner contour of said sheath member being established to provide space or play therebetween forming a damping cushion, said members being interconnected by zones of reduced area. In a typical embodiment, the inner core member has longitudinally extending grooves formed in the periphery thereof defining ribs therebetween the peripheral contour of which generally corresponds to the inner contour of the sheath member.
