Abstract (en)
[origin: EP0029230A2] A fire barrier device for a passage opening in a wall or a ceiling is described in which a slide guided by rollers in running rails can be moved in front of the passage opening. Particularly simple and gentle driving is achieved by virtue of the fact that the running rails (15) have a slight slope relative to the horizontal, with the result that the slide (17) can run in front of the passage opening under the action of gravity.
