Abstract (en)

An electrophotographic copier includes a belt photoconductor (24) which passes round a drum (32). It is guided from the drum to an exposure position by a vacuum plenum (34) which also serves to tension the belt. Rollers (28) and (30) guide the belt from the plenum to the exposure position and from that position back to the drum. Apart from the exposure station, the processing stations normally positioned adjacent the drum are so positioned.
