Abstract (en)

[origin: EP0030079A1] Method of, and apparatus for use in, the setting of the position of a sensor (17) of a contactless signal generator in an ignition distributor, in relation to the path of rotation of the vane (23) of the generator. The method includes the step of engaging with the sensor (17) a component (32, 33) which moves with the sensor during adjustment, and which has a thickness equal to the required spacing of a surface of the vane (23) from a corresponding surface of the sensor (17). The sensor (17) is moved relative to the casing of the distributor (11) until the component (32a, 33a) is trapped between the corresponding surfaces of the sensor (17) and vane (23) and the position of the sensor (17) is then fixed relative to the casing of the distributor (11).
