Abstract (en)
[origin: EP0030202A2] 1. Device enabling water to be heated for central heating and sanitary equipment, incorporating a horizontal tube (2) placed before the grate, on which are branched several tubes (3) which extend horizontally to form the bottom of the grate and which are then bent substantially at 90 degree to extend vertically and form the back of the grate, these tubes (3) having a bend of substantially 100 degrees which makes them return overhanging their horizontal part and then forming a hairpin to return backwards where they are branched on a second horizontal tube (5), situated above and having a diameter greater than that of the said horizontal tube (2), characterized in that it additionally incorporates steel skids (8) which extend vertically and which are arranged laterally at the vertical part of the said tubes (3), these skids (8) making it possible to hold the vertical part of the said tubes (3) at a distance from the back of the hearth and to concentrate the heat on these tubes (3).
