Abstract (en)
[origin: EP0031804A2] 1. A spatial lattice structure comprising at least one layer formed by an array of struts having a junction member at their ends, said junction members being joined together by bolts to form junction nodes, characterized in that each junction member is constituted by a hollow prismatic rigid member (6-7) having a cross-section in the form of an isoscele triangle and having its longitudinal axis extending transversally the axial direction of the strut (5) that bears it, a lateral face (6) of the hollow member being connected at an end of said strut transversally the axial direction thereof, said axial direction of the strut extending at a proper angle to said lateral face according to the type of the spatial structure, and each of the other lateral faces (7) of the hollow member being connected to one face of a similar junction member of another strut.
