Abstract (en)

This invention relates to roller or ice skate construction and includes a sole plate secured to or preferably embedded or encapsulated in the sole of a boot or shoe. A longitudinally extending channel or track extends below the plate (and below the under surface of the sole) and is formed integrally therewith, substantially along the center line of the sole plate. Skate trucks or sliders are provided with an attachment bolt assembly to secure the trucks or sliders at any desired location along the length of the track although the preferred embodiment includes stop means on the rear truck or slider to locate same at the rear end of the track and to maintain same in this position, as the location of the rear truck is generally static. A toe stopper assembly also slidably engages the track and is located at the front end thereof.
