Abstract (en)

1. Device for absorbing substantial dilations of linings on building structures, comprising at least one supporting surface of a fixed support (3) against which the panels (7) rest and a spring-action element (11) returning the panels (7) to their original positions and at the same time connecting neighbouring panels (7) among each other, characterized by the panels (7), arranged to abut against each other without constraint being clamped upon the fixed support (3) through a cover (8) and by the element (11) having a spring-action outward bend (12) arranged between the connecting means (10) of neighbouring panels (7) and bracing itself on both sides with its bent ends (13) at an acute angle against the walls (5) connecting the supporting surface (6) with the bottom plate (4) of the fixed support (3).

Abstract (de)

Die Fassadenplatten werden formschlüssig über ein verdecktes, federndes Element verbunden, welches alle Längenänderungen aufnimmt.
