Abstract (en)
In apparatus (38) which develops a latent image recorded on a flexible member (10), developer material is transported into contact with the flexible member (10) in the development zone (72), so as to develop the latent image. The flexible member (10) is maintained at a pre-selected tension. As the developer material contacts the flexible member (10) in the development zone (72) the flexible member (10) deforms so as to conform, at least partially, to the developer material.
