Abstract (en)  
[origin: EP0034818A2] 1. Facade element for the window area of a bracket mounted or aligned facade wall comprising a stationary frame (1) as well as an outer pane (5) and an inner pane (13) being positioned in an openable inner pane frame (12), said outer and inner panes are enclosing a pane space being vertically passed through by recirculated air, said pane space comprises at its one end an air inlet port (17) and at its opposite end an air outlet port leading into a downstream air-outlet conduit (18), characterized in that the outer pane (5) is positioned in an openable wing frame (3) formed by a wing frame profile (4) which extends over the largest part of the depth of the stationary frame (1), abuts room insidely the stationary frame and bears the inner pane frame (12) which only abuts with its vertical profiles the wing frame (3) and overlaps with its horizontal profiles (12a) the wing frame (3) maintaining thereby a distance from said wing frame in such a way that an air-supply conduit (17) and an air-outlet conduit (18), respectively, are formed extending over the whole width of the window.
