Abstract (en)
A method of making a structural joint between two cast concrete members using a strip of spaced reinforcement links (2) with a length of each link (2) embedded in a block (6) of a non-concrete material, in which a first concrete member (10, 20) is cast incorporating the strip with the block (6) of non-concrete material exposed at a surface thereof and the links (2) partially embedded in the concrete; and the non-concrete material is removed to expose said lengths of each link, about which a second concrete member (22) is cast. In order to improve the joint between the members (10, 20, 22) the strip is formed with a single continuous length of each link (2) embedded in the block (6) of non-concrete material and at least one connecting member (18) is coupled to the said lengths of link (2) exposed after the non-concrete material is removed, before the second concrete member (22) is cast around the connecting member (18) and links (2).
