Abstract (en)

[origin: EP0035176A1] 1. Locking device for remotely operated pivoting-sliding doors especially on rail vehicles, the locking element of which is kept in a closed position by means of a spring (21) and moved in an opened position by means of a pressure transmitter (22), whereby the locking element consists of an angle lever (16) which is pivotably borne around a bolt (19) at its vertex and in active connection with a reversing lever (7), characterized in that an arm (3) of the reversing lever (7) is flexibly connected with the piston rod (2) of the cylinder (1) of the door drive and that another arm (6) of the reversing lever (7) possesses a swivel roller (20) against which, solely in the closed position, one leg (17) of the angle lever is pressed so that a turn of the reversing lever (7) caused by the door drive is blocked and that, in the opened position, the active connection between the angle lever (16) and the reversing lever (7) is cancelled.
