Abstract (en)

[origin: US4357612A] A multimode ultrahigh-frequency source with wide passband comprises a rectangular waveguide with a cavity terminating at an exit aperture in a horizontally flared horn, an input end of the cavity remote from the horn being joined at a transverse discontinuity plane to an upper and a lower pair of symmetrically disposed rectangular supply guides that are vertically separated from each other. An obstruction in the form of a block located between the levels of the supply guides extends from the discontinuity plane forward into the cavity and converges toward the horn in the vertical E-plane, e.g. with a trapezoidal cross-section. With the supply guides excited in the basic TE10 mode, a suitable dimensioning of the block will maintain a cophasal relationship between this basic mode and a hybrid mode EM12, originating at the discontinuity plane, in the exit aperture of the cavity over a wide frequency band.

Abstract (fr)

Source hyperfréquence multimode, à large bande passante constituée par une cavité (12), formant modeur E, excitée dans le mode fondamental par un groupement de guides d'alimentation (9-10,90-100), comprenant un obstacle profilé (17) s'étendant entre le plan d'entrée (P) de la cavité et le plan d'excitation (PB) d'un mode hybride pour les fréquences basses de la bande. Application aux sources multimodes pour radars, antennes spatiales de télécommunications.
