Abstract (en)

[origin: EP0036586A2] The invention relates to a power generating system which utilizes the wave motion of the sea or lakes, and includes a buoyant member (11), preferably of a large size, which is adapted for following the water surface movements, a restrain (1) arranged to govern the buoyant member (11), at least one pumping apparatus (4) which is arranged to be actuated by the buoyant member and adapted for pumping a fluid into a storage tank. The fluid from the storage tank can be utilized by a consumption apparatus, such as a turbine, in order to generate power, e.g. electric power.
