Abstract (en)
[origin: EP0037446A1] An austenitic stainless steel is described for use in an environment where the steel will be subject to neutron irradiation. The steel exhibits a good phase stability in both the annealed as well as cold work condition and above all a superior resistance to radiation induced swelling. The alloy contains from 1.5% to 2.5% manganese, from 0.5% to 1.1% silicon, from 12% to 14% chromium, from 14% to 16% nickel, from 1.2% to 1.7% molybdenum, from 0.2% to 0.5% titanium, up to 0.1% zirconium, up to 0.01% boron the balance being iron with incidental impurities.
