Abstract (en)
[origin: EP0037901A1] 1. A cover device for the nozzle surface on an ink jet head in a marginal position, having a covering medium which can be brought with a new region of covering surface in front of the nozzle surface by rotation and against the nozzle surface by an adjusting means and having a source of driving power for the rotation and for the movement of the adjusting means, characterised in that the means (47) for the movement of the covering medium (50) by rotation (arrow 48) and the adjusting means (cams 9, 10, 11) are each adapted for coupling selectively to a common shaft (6), driven selectively counterclockwise or clockwise by the source (4) of driving power, by means of a controllable coupling element.
