Abstract (en)

[origin: ES8202494A1] The coating device of the invention, which enables a layer of product to be deposited on a strip (1) travelling between two rotary cylinders (2, 3), is characterized in that it comprises a reserve (8) containing the coating product a first roller (9) associated with the reserve for continuously taking therefrom a specific amount of coating product a second roller (10) bearing against one of the rotary cylinders (3, 2), the first and second rollers being parallel and spaced from each other a third loosely mounted roller (11), bearing on the first and second rollers means (M1) for rotating the first roller and imparting thereto a constant preadjusted speed and means (M2) for rotating the second roller and imparting thereto a speed equal to the travelling speed of the strip, the first and second rollers rotating in the same direction .
