Abstract (en)

Apparatus for treating granular material, especially granular, vegetable material, to remove at least part of an outer layer from individual grains of the material, comprises a trough [1], a pair of overlapping discs [4] situated in the trough, each disc being mounted for rotation about an axis perpendicular to the plane of the disc, the two axes of rotation being parallel to one another and the two discs of the pair overlapping one another, but neither disc overlapping the other as far as the axis of rotation of the other, the facing surfaces of the discs of the pair of discs being generally planar, and means for causing the discs to rotate about the said axes, the arrangement being such that the granular material is treated by interaction with the facing surfaces of the pair of discs. A method for so-treating granular material involves using such apparatus.
