Abstract (en)
[origin: US4375790A] The offset printer is intended for printing annular codes of colors on small solids of revolution like contact pins or necks of ampoules. A plurality of axially shifted devices for distributing the color, each one comprising a color disc are assigned to the inking cylinder. The color discs enter into a color chamber and come out from this chamber free from play between axial limitations which act as strippers. The color discs are joined with their drive in a slightly loose manner so that they can fully adapt themselves to the position of the axial limitations. This permits to print fully clean, small rings of colors on small solids of revolution.
