Abstract (en)
[origin: ES267730U] The invention relates to a support for child having an articulated framework, a bottom supported by this framework and a body element forming at least partial connection between the bottom and the framework. The framework has parallel longitudinal elements and hoop elements articulated on the longitudinal elements and forms a deformable parallelogram. One of the hoop elements, located at the foot end of the framework, is provided with an element which is fast therewith to constitute foot rest, while the body element comprises a rigid bottom made of two parts articulated transversely to each other. The bottom part closer to the foot rest is free with respect to the body element and supported by a crosspiece coupled to the framework in the form of a stirrup the other bottom part is rendered fastened to the body element.
