Abstract (en)

[origin: EP0042353A2] This equipment has an image screen (2), the inner surface (7) of which is provided with a coating (8). The transparency of the image screen (2) is reduced by the coating (8) by 15 to 50 %. When the light source (3) is switched off, the coating (8) prevents the image on the film (4) from shining through the screen (2). By this means, the movement of the film (4) when it is changed, does not have a disturbing effect on the viewer. <IMAGE>
