Abstract (en)  
[origin: EP0043168A1] Improvements in cupboards, shelf units and the like having displaceable shelves (5) or the like as well as end walls and possibly also intermediate walls (3) comprise rails (7) or the like extending in the vertical direction of these walls in combination with brackets (13) or the like, which are secured to the shelves (5) and are adapted to cooperate with the rails. To make possible mounting of the shelves on different levels and shift of the shelves in the vertical direction the rails have a cross-section of a substantially sawtooth-shaped profile for forming shoulders (10) facing upwards at the transitions between two adjacent saw-teeth, each bracket also having at least one flexible tongue (15) which projects from the end edge of the shelf to which the bracket is secured for carrying this end edge upon one of the shoulders (10).
