Abstract (en)
[origin: EP0045284A2] The reinforcing element for plane load-bearing structures of reinforced concrete consists of a grid-like network of longitudinal and transverse bars (10, 11) which are arranged without exception at equal spacings (10C, 11C) within the field and which have double the spacing (10B, 11B) in the edge regions. By a subdivision of the length of 5 m and the width of 2.15 m, 19 longitudinal bars and 20 transverse bars are provided. During laying, both the longitudinal and the transverse bars are arranged centrally in a gap of the element to be connected. It is thus possible to reduce the types to be kept in stock, bring about a weight saving in the joining regions and, without any outlay, check the correct laying by means of the without exception identical spacings between the bars of laid reinforcing elements. <IMAGE>
