Abstract (en)

The present invention relates to a device and relevant complementary elements for the suspension of furniture articles to wall wood coverings, composed of side-by-side panels with a slit between a panel and the following one. This device is constituted by a block, substantially parallelepiped and made of plastic material, which extends vertically and presents transversally a width sufficient to penetrate in the slit between two side-by-side panels. The device, moreover, presents in the rear part two opposing coplanar wings projecting toward the outside, intended to rest against the rear borders of the side-by-side panels. Finally, the device presents in the front part a threaded hole for the engagement of a screw, above and below which two projections extend toward the front. Each complementary element, independently from its shape and main purpose, is characterized by having: a wall which presses against the external surface of the side-by-side panels under the tightening action of a blocking screw so as to vice, between itself and the rear wings of the device, the thickness of the panels, thus forming sort of a clamp which makes the coupling stable; by having two notches, or seats, suitable to receive the above-mentioned projections of the device itself, so as to create a coupling which hinders the relative rotation between the device and the complementary element, beside setting exactly the position of the latter.
