Abstract (en)

[origin: WO8102833A1] Ailments occur by inoperative states of the molecular mechanisms in the tissue. There are functional electrons in the molecular mechanisms, which rotate back and forth angularly within an arc of 45 degrees in normal operation. When these electrons rotate more than 45 degrees, they keep on rotating toward 90 degrees, and 180 degrees. Because of operational interrelationship between molecules, adjacent molecules also become inoperative step by step, and lose their normal magnetic rejection to foreign molecules, and growth starts by invasion, as cancer. These depolarized electrons cannot return back to their normal polar normalizations, and therefore, artificial polar control is required. These mechanisms, however, are arrayed in the tissue three dimensionally, and the invention provides radiation of electron-attracting field that rotates two dimensionally in the tissue in at least three mutually perpendicular planes, for normalizing the depolarized electrons, as cure of cancer.
