Abstract (en)

Disclosed is a process for machining nickel-base superalloys wherein a thermal-effect process, such as laser or electric discharge machining, is first used to remove material but leaves a recast layer. Next a chemical milling process is used wherein the etchant only attacks and removes the recast layer. The etchant is comprised by volume percent of 40-60 HNO₃, 5-20 HCl, and 20-55 H₂O, with which is included 0.016-0.025 moles/liter FeCl₃ and at least 0.008 moles/liter CuSO₄. The FeCl₃ improves removal rate but tends to cause unwanted pitting and intergranular attack. These tendencies are inhibited by the addition of CuSO₄; preferably the molar ratio of CuSO₄ to FeCl₃ is 2:1. The beneficial combination of FeCl₃ and CuSO₄ is usable in other etchants.
