Abstract (en)

[origin: WO8102796A1] A method of color imaging involves the steps of (a) forming an image while introducing a predetermined chromatic difference in lateral magnification, (b) storing the image on a medium such as color film, and (c) forming from the stored image, another image, while introducing a chromatic difference in lateral magnification that is opposite to the predetermined difference in lateral magnification introduced in step (a). The system of the invention has, in a basic embodiment, a first lens system (3) for forming an image while introducing a predetermined chromatic difference in lateral magnification, a medium such as color film (4) to store the image, and a second lens system to form, from the stored image, a second image while introducing a chromatic difference in lateral magnification that is opposite to the predetermined chromatic difference in lateral magnification introduced by the first lens system. The invention also relates to the stored images formed as described above.
