Abstract (en)
A memory device, which comprises a capacitor (20) connected to a power supply terminal (10) through a main switch (12) to be used as a data holding power source and also connected to a read write memory (24). The memory device further comprises a comparator (22) which compares the level of the terminal voltage of the capacitor (20) with a minimum level of the data holding voltage of the memory (24) and a transistor (16) which is connected between the main switch (12) and capacitor (20) and rendered conducting in accordance with an output signal from the comparator (22).
