Abstract (en)

[origin: EP0050204A2] The invention relates to a device for supporting the elbow joints (9) of a person employed in polishing glass articles on a work stage (1) of a polishing machine. It consists essentially of an elastic supporting ring (5) arranged flat and of essentially round cross-section. The elbow joint (9) can be inserted into the clear width (8) of the supporting ring. The dimensions of the cross-sectional radius (14) and clear width (8) are selected so that the angled elbow joint (9) inserted into the clear width does not pass through the clear width completely. <IMAGE>
