Abstract (en)
[origin: EP0050439A2] Double-leaflet heart valves having an annular valve body (103) and a pair of pivotable leaflets (105) which may be arcuate or flat in cross section. Guides (131) protrude oppositely from the leaflets (105) and are received in complementary depressions (111) in the interior wall surface (117) of the annular valve body at generally diametrically opposite locations. Eccentric pivot axes provide for quick response of the leaflets (105), and small rounded knobs (137) of the guides (131) are received in the depressions (111) which assure the alignment is maintained. The depressions (111) are preferably elongated so that, as the leaflets (105) pivot between the open and closed positions, the guides (131) move from one end of the elongated depressions (111) to the other.
