Abstract (en)
[origin: EP0050861A2] The invention relates to a coding switch having higher conductor tracks (2) which are arranged on a circuit board (1) and can be bridged by a slider (7). In this coding switch, the slider is mounted in shell-shaped adjusting rings (3, 4), preferably in the manner of a clamping disc pressed onto a moulded-on pin (7). The slider (7) has fingers (8) which bridge the conductor tracks. A locking pin (13) passing through the circuit board (1) is used as support for the adjusting rings (3, 4) so that, in addition, two adjusting rings can be arranged on both sides of the circuit board (1). The coding switch according to the invention can be preferably used for electronic digital circuits. <IMAGE>
