Abstract (en)

[origin: US4446630A] Method and apparatus for the slow cooling of grain in which warm grain is introduced into the upper end of a silo and cooling air is introduced at the lower end and is evacuated at an intermediate point between the upper and lower ends of the silo. The warm grain descends through the silo in a non-ventilated space above the intermediate point where the internal moisture is removed, then into a ventilated space where it is cooled by the cooling air and finally to the lower end of the silo from which the cooled grain is extracted.

Abstract (fr)

Procd consistant  effectuer le refroidissement lent diffr du grain en continu lors de sa progression de haut en bas  l'intrieur d'une colonne (1, 2), en prvoyant une admission d'air (4, 5)  la base de la colonne et une sortie d'air 4 (6, 7)  un niveau intermdiaire, de faon telle que le grain subisse tout d'abord un ressuyage de son humidit interne sans ventilation, puis un schage et un refroidissement sous l'effet de l'air de ventilation. Son extraction  la base de la colonne peut s'effectuer par un systme de vis. Cette base est constitue de prfrence par une structure autoporteuse  poutres formant des gaines de distribution de l'air.
