Abstract (en)

[origin: ES8303765A1] A price setting mechanism of a vending machine for setting one of two or more sales prices is disclosed. Merchandise dispensing devices are mounted on an operating base plate. Depending on the sales price, at least one control bar is coupled to a respective merchandise dispensing device, on the one hand, and to a release mechanism for the merchandise dispensing device on the other. To make the setting mechanism simple and clearly settable, there are fastened to the control bar or bars, guide bushings which extend transverse to the travel direction of the control bars and in which slide pins are mounted. In one position, one end of each slide pin projects into the path of motion of a control cam of the merchandise dispensing device while being outside of the path of motion of the control cam in a second position thereof. The other end of the slide pins project beyond this bushing in each one of the two positions, on the operating base plate side which is opposite the merchandise dispensing devices.
