Abstract (en)
1. Multiple glazing unit for insulation comprising at least two parallel glass sheets (4a, 4b) and, positioned between the border zones of their surfaces that face each other, spacer frames (1), each of which is formed from profile tubes (5) and from angle pieces (6) which locate in the cavities of the profile tubes with pegs (12a, 12b) and which contain corner members with two lateral contact surfaces that are parallel with each other and with the glass sheets and lie essentially in the same planes as the lateral contact surfaces of the profile tubes, these surfaces being parallel with the glass sheets, and elastomer strips (2a, 2b) positioned between elastomer strips (2a, 2b) positioned between the contact surfaces of the spacer frames and the border zones and forming a vapour diffusion barrier, in which at least two closable gas feed or gas outlet holes (15) lead through the angle pieces of each spacer frame from the external side to the inter-sheet space (9) bounded by the spacer frame and the glass sheets, and in which the cavity of at least one profile tube of each spacer frame contains in at least a part of its longitudinal extent a dessicant (7) which is in contact with this inter-sheet space via openings, characterised in that each spacer frame (1) has at least one angle piece (6, 6') which has between the corner member (11, 11') and at least one (12b, 12'b) of its two pegs (12a, 12'a, 12b, 12'b) a side piece (13, 13'), in which at least its lateral contact surfaces (13a) lie essentially in the same planes as the lateral contact surfaces (11a, 5a) of both the corner member (11, 11') and the profile tubes (5), and that through these side pieces (13, 13') extend the gas feed or gas outlet holes (15), the axes (15a) of which are essentially parallel with the lateral contact surfaces and perpendicular to the side piece (13, 13').

Abstract (de)
Zwei parallele Glasscheiben (4a,4b) enthalten einen zwischen den Randzonen (3a,3b) ihrer aufeinander zuweisenden Flächen angeordneten Distanzrahmen (1) der aus Profilrohren (5) und aus Winkelstücken (6) gebildet ist, welche mit Zapfen (12a,12b) in die Hohlräume (5c) der Profilrohre (5) einstehen und welche Eckkörper (11) mit zwei zueinander und zu den Glasscheiben (4a,4b) parallelen seitlichen Anlageflächen enthalten, die im wesentlichen in den gleichen Ebenen mit den zu den Glasscheiben (4a,4b) parallelen seitlichen Anlageflächen der Profilrohre liegen, sowie aus zwischen den Anlageflächen der Distanzrahmen und den Randzonen angeordneten, eine Dampfdiffusionssperre bildenden Elastomerstreifen (2a,2b) besteht. Jeder Distanzrahmen (1) weist mindestens ein Winkelstück (6) auf, welches zwischen dem Eckkörper (11) und mindestens dem einen (12b) seiner beiden Zapfen (12a,12b) ein Schenkelstück (13) enthält, dessen seitliche Anlageflächen jeweils mit den seitlichen Anlageflächen des Eckkörpers (11) und der Profilrohre (5) im wesentlichen in gemeinsamen Ebenen liegen und daß sich durch diese Schenkelstücke (13) die Gaseinfüll- bzw. Gasauslaßbohrungen (15) erstrecken, deren Achsen (15a) im wesentlichen parallel zu den seitlichen Anlageflächen und rechtwinklig zum Schenkelstück (13) verlaufen.
