Abstract (en)
A washing machine has its drum/drive mechanism and tub assembly mounted upon transducers which provide an indication of the weight of the mechanism and assembly and of the weight of articles loaded into the drum for washing. The transducers input (26) to a microprocessor (27) which determines the weight of the clothes and also the weight of water required to wash that weight of clothes under program conditions some at least of which are selected by the user. The microprocessor may also control a display (29) which indicates the amount of detergent required.
