Abstract (en)

[origin: WO8201801A1] Circuit for signalling, by means of a signalling device, the defaults at a current consumer connected through an electronic coupling device, with which a control signal, causing the insertion of the current consumer, may be brought at the input of the electronic coupling device by a control line. In order to reduce the number of input lines in a control station, the input resistance of the electronic coupling device may be varied by means of an impedance controlled by a default signal and the signalling device is actuated in relation to the current circulating in the control line so as to give a default indication when the current in the control line deviates from its value in the absence of default.
