Abstract (en)
[origin: WO8103651A1] Device at printing plants for providing a web, preferably a formaliner-perforated paper web, with information, whereby the web (1) runs from a feeding device (2) via an inlet sensor (3) to a printer unit (4) and therefrom via an outlet sensor (5) to a receiving device (6) and whereby the inlet sensor controls the feeding device to feed the web such that it runs in slacked condition to a feeding unit (23) for feeding thereof through the printer unit while the outlet sensor controls the receiving device to feed the web such that it runs in slacked condition from the feeding unit. In order to provide by simple means a device permitting efficient feeding and collecting of webs provided with prints in printing plants operating at high printing speeds, the invention is characterized by the fact that the receiving device (6) comprises a web driving device (34) controlled by the outlet sensor (5) and holding the web (1), that in said web driving device the web portion (1c) running from the feeding unit (23) in slacked condition is transformed into a stretched web portion (1d) under the influence of a reeling device (35) and a web drawing unit (37).
