Abstract (en)  
[origin: EP0054449A1] 1. A window-raiser comprising at least one inclined arm (26, 27) which is pivotally mounted at an intermediate point of its length on a pivot pin (29) carried by a slide (30) which is longitudinally guided in a U- or C-section member forming a substantially vertical slideway (31) and carries a rack (38) engaged with a driving pinion through a lateral opening in the U- or C-section member, the two ends of the arm being guided in the guideways (17, 18, 24) perpendicular to the axis of the slideway (31) which are respectively connected to the window base and fixed, the fixed guideway (54) defining a central line to each side of which line the arm is movable, characterized in that the inner wall of the vertical slideway section-member (31) has a pierced or cut-away aperture in the region of which the material is deformed inwardly of said slideway so as to form the inner wall (41) of a cavity (39), which is laterally open on each side of said wall, and define an opening (40) through which a pinion which is part of a driving module assembled with the slideway is mounted inside the section-member in the cavity (39) and put into engagement with the rack (38).
