Abstract (en)  
[origin: EP0058369A2] 1. A feed device for wood-working machines, more especially for milling machines for the longitudinal profiling of timber pieces, which consists of several milling spindles which are arranged behind one another in the feed direction, in which the feed device has several individual feed units (1) which are arranged one behind the other and which are respectively provided with at least two driven feed rollers (2), are mounted on a common bearer (6) and are swingable about a perpendicular axis relative to the carrier, characterised in that a continuous driving shaft (4) is provided for the individual feed units (1) which extends above the feed units, and on which, for each feed unit (1), in each case a gearing consisting of two bevel gears (22, 23) lying at a right angle to one another, is arranged, to which a perpendicularly-extending driven shaft (14) links, to which the individual horizontally-extending driving shafts (26, 31, 32) for the feed rollers (2) are connected in their turn, by a further right-angled bevel gearing (24, 25).
